

1. Consider the equation for the volume of a cylinder

$$V = \pi r^2 h$$

where  $r$  represents the radius and  $h$  represents the height.

- Determine the relationship between volume,  $V$ , and radius,  $r$ . Express the relationship in both words and symbols.
- Determine the relationship between volume,  $V$ , and height,  $h$ . Express the relationship in both words and symbols.

Determine the change in volume for each of the following changes.

- The height is increased by a factor of four.
- The radius is halved.
- The radius is decreased by a factor of three and the height is doubled.

A cylindrical glass can hold 400 mL of water. Determine how much water the glass can hold for each of the following changes.

- The height is tripled.
- The radius is doubled.
- The radius is halved and the height is decreased by a factor of four.

2. Consider the equation for magnetic field around a current-carrying wire

$$B = \frac{\mu_0 I}{2\pi d}$$

where  $\mu_0$  represents the permeability of free space (a constant),  $I$  represents the the current through the wire and  $d$  represents distance from the wire.

- Determine the relationship between magnetic field,  $B$ , and current,  $I$ . Express the relationship in both words and symbols.
- Determine the relationship between magnetic field,  $B$ , and distance,  $d$ . Express the relationship in both words and symbols.

Determine the change in magnetic field for each of the following changes.

- The current is halved.
- The distance from the wire is decreased by a factor of five.
- The current is increased by a factor of ten and the distance from the wire is tripled.

A long wire carries a current of 100 mA. At a distance  $x$  from the wire, the magnetic field is found to be 20 nT. Determine the magnetic field for each of the following changes.

- The current is decreased to 25 mA.
- The distance from the wire is increased to  $5x$ .
- The current is increased to 300 mA and the distance from the wire is decreased to  $x/4$ .

3. Consider the equation for the period of a mass-spring oscillator

$$T = 2\pi\sqrt{\frac{m}{k}}$$

where  $m$  represents the mass and  $k$  represents the spring constant.

- Determine the relationship between period,  $T$ , and mass,  $m$ . Express the relationship in both words and symbols.
- Determine the relationship between period,  $T$ , and the spring constant,  $k$ . Express the relationship in both words and symbols.

Determine the change in period for each of the following changes.

- The mass is decreased by a factor of four.
- The spring constant is increased by a factor of nine.
- The mass and spring constant are both tripled.

A mass attached to a spring oscillates with a period of 0.80 seconds. Determine the period for each of the following changes.

- The spring constant is decreased by a factor of four.
- The mass is increased by a factor of 25.
- The mass is halved and the spring constant is increased by a factor of eight.

4. Consider the equation for the electric force between two charges

$$F_e = k \frac{q_1 q_2}{r^2}$$

where  $k$  represents the electrostatic constant,  $q_1$  and  $q_2$  represent the charges and  $r$  represents the separation distance.

Two charges are separated by a distance of 20 mm. The electric force at this distance is 2 N. Determine the electric force between the charges for the following changes.

- One charge is halved.
- Both charges are increased by a factor of three.
- The distance separating the charges is increased to 100 mm.
- The distance separating the charges is decreased to 10 mm.
- The distance separating the charges is decreased to 50 mm.
- One charge is halved and the distance separating the charges is decreased to 10 mm.
- Both charges are increased by a factor of ten and the distance separating the masses is increased to 100 mm.
- One charge is doubled, the other is decreased by a factor of five, and the distance separating them is decreased to 4 mm.
